DETAILED ACTION

Response to Arguments

Applicant's arguments filed 27 March 2008 have been fully considered but they are not persuasive.

In response to applicant's argument that McCaughan '791 does not teach a single photon generator, '791 is not relied upon to teach all limitations of the single photon generator of claim

1. Takeuchi '824 is relied upon to teach the single-photon generation device comprising a laser-light source (col. 7, lines 35-37 and Fig. 6, part 9), a quasi-phase-matching wave-guide (col. 7, lines 35-39 and Fig. 6, part 39) that converts one photon from said laser-light source into two photons with a common wavelength (col. 7, lines 61-65), a beam splitter that separates the two photons (col. 7, lines 47-51 and Fig. 6, part 41), a single-photon detector that detects one of the separated photons (col. 7, lines 49-51 and Fig. 6, part 2), and an optical switch that puts the other of the separated photons in and is controlled with the detection signal of said single-photon detector (col. 5, lines 36-40 and Fig. 6, part 4). '824 does not explicitly teach the quasi-phase-matching wave-guide being a wave-guide-type quasi-phase-matching LiNb0₃. Therefore, '791 is introduced to teach the use of a quasi-phase-matching LiNb0₃ waveguide (col. 11, lines 64-67) in order to provide better overlap between the optical and microwave fields.

In response to applicant's argument that Baer '911 does not teach a single photon generator, '911 is not relied upon to teach all limitations of the single photon generator of claim

1. Takeuchi '824 is relied upon to teach a single-photon generation device comprising a laser-light source (col. 7, lines 35-37 and Fig. 6, part 9), a non-degenerate quasi-phase-matching wave-guide (col. 7, lines 35-39 and Fig. 6, part 39) that converts one photon from said laser-light

Art Unit: 2828

source into two photons (col. 7, lines 61-65) with different wavelengths (col. 9, lines 58-60), a beam splitter that separates the two photons with the different wavelengths (col. 7, lines 47-51 and Fig. 6, part 41), a single-photon detector that detects one of the separated photons (col. 7, lines 49-51 and Fig. 6, part 2), and an optical switch that puts the other of the separated photons in and is controlled with the detection signal of said single-photon detector (col. 5, lines 36-40 and Fig. 6, part 4). '911 is relied upon to teach the use of a dichroic mirror beam splitters (col. 3, lines 50-54) in order to provide better beam quality and sharpening intensity. Therefore, the combination of '911 and '824 is proper, since '824 teaches the use of a beam splitter in a single photon generator and '911 teaches the use of a dichroic mirror as a beam splitter (col. 7, lines 47-51 and Fig. 6, part 41).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1 and 3 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takeuchi (U.S. Patent 7,088,824, hereafter '824) in view of McCaughan et al (U.S. Patent 6,545,791, hereafter '791).

Claim 1: '824 teaches a single-photon generation device comprising a laser-light source (col. 7, lines 35-37 and Fig. 6, part 9), a quasi-phase-matching wave-guide (col. 7, lines 35-39 and Fig.

Art Unit: 2828

6, part 39) that converts one photon from said laser-light source into two photons with a common wavelength (col. 7, lines 61-65), a beam splitter that separates the two photons (col. 7, lines 47-51 and Fig. 6, part 41), a single-photon detector that detects one of the separated photons (col. 7, lines 49-51 and Fig. 6, part 2), and an optical switch that puts the other of the separated photons in and is controlled with the detection signal of said single-photon detector (col. 5, lines 36-40 and Fig. 6, part 4).

'824 does not explicitly teach the quasi-phase-matching wave-guide being a wave-guide-type quasi-phase-matching LiNb0₃. However, '791 teaches the use of a wave-guide-type quasi-phase-matching LiNb0₃ (col. 11, lines 64-67) in order to provide better overlap between the optical and microwave fields. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made use a wave-guide-type quasi-phase-matching LiNb0₃ as the quasi-phase-matching wave-guide in order to provide better overlap between the optical and microwave fields.

Claim 3: '824 teaches a single-photon generation device comprising a laser-light source (col. 7, lines 35-37 and Fig. 6, part 9), a quasi-phase-matching wave-guide (col. 7, lines 35-39 and Fig. 6, part 39) that converts one photon from said laser-light source into two photons (col. 7, lines 61-65) and put them out to different directions (col. 7, lines 42-44 and Fig. 6, part 41), a single-photon detector that detects one of the separated photons (col. 7, lines 49-51 and Fig. 6, part 2), and an optical switch that puts the other of the separated photons in and is controlled with the detection signal of said single-photon detector (col. 5, lines 36-40 and Fig. 6, part 4).

'824 does not explicitly teach the quasi-phase-matching wave-guide being a bulk type wave-guide-type quasi-phase-matching LiNb0₃. However, '791 teaches the use of a bulk type

(col. 11, lines 14-15) wave-guide-type quasi-phase-matching LiNb0₃ (col. 11, lines 64-67) in order to provide better overlap between the optical and microwave fields. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made use a bulk type wave-guide-type quasi-phase-matching LiNb0₃ as the quasi-phase-matching wave-guide in order to provide better overlap between the optical and microwave fields.

Page 5

Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Takeuchi (U.S. Patent 7,088,824, hereafter '824) in view of McCaughan et al (U.S. Patent 6,545,791, hereafter '791) and further in view of Baer (U.S. Patent 5,866,911, hereafter '911).

'824 teaches a single-photon generation device comprising a laser-light source (col. 7, lines 35-37 and Fig. 6, part 9), a non-degenerate quasi-phase-matching wave-guide (col. 7, lines 35-39 and Fig. 6, part 39) that converts one photon from said laser-light source into two photons (col. 7, lines 61-65) with different wavelengths (col. 9, lines 58-60), a beam splitter that separates the two photons with the different wavelengths (col. 7, lines 47-51 and Fig. 6, part 41), a single-photon detector that detects one of the separated photons (col. 7, lines 49-51 and Fig. 6, part 2), and an optical switch that puts the other of the separated photons in and is controlled with the detection signal of said single-photon detector (col. 5, lines 36-40 and Fig. 6, part 4).

'824 does not explicitly teach the quasi-phase-matching wave-guide being a wave-guide-type quasi-phase-matching LiNb0₃. However, '791 teaches a wave-guide-type quasi-phase-matching LiNb0₃ (col. 11, lines 64-67) in order to provide better overlap between the optical and microwave fields. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made use a wave-guide-type quasi-phase-matching LiNb0₃ as the quasi-

Art Unit: 2828

phase-matching wave-guide in order to provide better overlap between the optical and microwave fields.

'824 and '791 do not explicitly teach the beam splitter being a dichroic mirror. However, '911 teaches the use of dichroic mirror beam splitters (col. 3, lines 50-54) in order to provide better beam quality and sharpening intensity. Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made use a dichroic mirror for the beam splitter in a single photon generation device in order to provide better beam quality and sharpening intensity.

Conclusion

1. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
